Project Development Phase

Introduction

The Project Development Phase focuses on implementing the Automated Ticket Assignment System using the ServiceNow platform. In this phase, the system components designed earlier are created and configured in the ServiceNow environment.

The development process includes creating users, defining roles, organizing support groups, designing database tables, configuring access control rules, and implementing automated workflows using Flow Designer.

These components work together to ensure that when a support ticket is created, the system automatically assigns it to the appropriate support group based on the issue type. This eliminates manual ticket routing and improves the efficiency of support operations.

Creating Users

Users represent individuals who interact with the system. In this project, users are created to simulate support staff and system participants.

To create users in ServiceNow:

1. Navigate to **System Security → Users**.
2. Click **New** to create a new user record.
3. Enter the required details such as:
    - First Name
    - Last Name
    - User ID
    - Email
    - Password
4. Click **Submit** to save the user.

Multiple users are created to represent different members of the support teams.

Creating Groups

Groups represent teams responsible for handling specific categories of support tickets.

To create groups:

1. Navigate to **System Security → Groups**.
2. Click **New** to create a group.

3. Enter the following details:
    - Group Name
    - Description
    - Manager (optional)
4. Click **Submit** to save the group.

In this project, two groups are created:

• **Certificates Group**
• **Platform Group**

These groups are responsible for handling certificate-related issues and platform-related issues respectively.

Creating Roles

Roles define the permissions that users have within the system.

To create roles:

1. Navigate to **System Security → Roles**.
2. Click **New**.
3. Enter the following information:
    - Role Name
    - Description
4. Click **Submit**.

The roles created in this project include:

• **Certificate Role** – Handles certification-related support tickets.
• **Platform Role** – Handles platform-related support tickets.

These roles ensure proper access control and responsibility assignment.

Creating the Database Table

A custom table is created to store support ticket information.

Steps to create the table:

1. Navigate to **System Definition → Tables**.
2. Click **New**.
3. Enter the following details:
    - Label: **Operations Related**
    - Enable **Create Module**

    - Enable **Create Mobile Module**
4. Click **Submit**.

This table stores all the support tickets raised by users.

Important fields include:

• Issue
• Description
• Assigned To
• Status
• Ticket Raised Date
• Priority

The **Issue field** contains predefined options such as:

• Unable to login to platform
• 404 error
• Regarding certificates
• Regarding user expired

These choices help categorize tickets and trigger automated workflows.

Assigning Roles and Users to Groups

Users and roles are assigned to groups so that the appropriate team members can handle specific tickets.

For example:

Certificates Group

- User assigned: Katherine Pierce
- Role assigned: Certificate Role

Platform Group

- User assigned: Manne Niranjan
- Role assigned: Platform Role

This ensures that each support team member has the correct permissions to handle their assigned tickets.

Assigning Roles to the Table

To ensure secure access to the ticket table, roles are assigned to control who can read or write data.

Steps include:

1. Open the **Operations Related** table.
2. Navigate to the **Application Access** tab.
3. Elevate the role to **security_admin**.
4. Add the required roles to the **Read** and **Write** permissions.

Roles added:

• Platform Role
• Certificate Role

This ensures that only authorized users can access or modify ticket records.

Creating Access Control Rules (ACL)

Access Control Rules are created to protect sensitive data fields.

Steps to create ACL:

1. Navigate to **System Security → Access Control (ACL)**.
2. Click **New**.
3. Define the table, operation, and field.
4. Assign the required role.

ACLs are created for fields such as:

• Issue
• Priority
• Ticket Raised Date

These rules ensure that only authorized users can access or update these fields.

Creating Automated Flows

Automated flows are implemented using **Flow Designer** to assign tickets automatically.

Certificate Ticket Assignment Flow

When a ticket is created with the issue **"Regarding Certificates"**, the system automatically assigns the ticket to the **Certificates Group**.

Platform Ticket Assignment Flow

When a ticket is created with issues such as:

• Unable to login to platform
• 404 error
• Regarding user expired

the system automatically assigns the ticket to the **Platform Group**.

These flows eliminate manual ticket assignment and improve response efficiency.

Streamlining-Ticket-Assignment-…

Testing the System

After configuring the flows, test tickets are created in the **Operations Related table**.

Results:

• Certificate-related tickets are automatically assigned to the **Certificates Group**.
• Platform-related tickets are automatically assigned to the **Platform Group**.

This confirms that the automated ticket routing works correctly.
