Project Documentation

Introduction

Project documentation is an important part of the software development process. It provides a detailed description of the project, including its objectives, design, development process, and implementation details. Proper documentation helps users, developers, and evaluators understand how the system works and how it was developed.

In this project, documentation has been prepared to explain the implementation of the **Automated Ticket Assignment System using the ServiceNow platform**. The documentation includes information about the system architecture, database structure, roles and groups, workflow automation, and screenshots of the system output.

The purpose of this documentation is to clearly present the complete development process of the project and to provide guidance for future reference or system improvements.

Documentation Contents

The project documentation includes several sections that explain the entire system development process.

The main sections included in the documentation are:

• Introduction to the project
• Project objectives and features
• Requirement analysis
• System design
• Project planning
• Project development process
• Implementation details in ServiceNow
• Screenshots of system output
• Project conclusion

These sections help provide a complete overview of how the project was designed and implemented.

Implementation Documentation

The documentation also explains the technical implementation steps performed in ServiceNow. These include:

• Creating users in the system
• Creating support groups
• Defining system roles
• Assigning users and roles to groups
• Creating a custom table for ticket management
• Implementing access control rules for security
• Configuring automated workflows using Flow Designer

Each of these steps is described with explanations and screenshots to demonstrate the working of the system.

Screenshots and Output

Screenshots are included in the documentation to visually demonstrate the system implementation. These screenshots show:

• User creation page
• Group configuration
• Role creation
• Custom table creation
• Access control configuration
• Flow Designer setup
• Ticket creation and automatic assignment

These images help readers understand how the system is configured and how the automated ticket assignment works.

Importance of Documentation

Proper documentation provides several benefits:

• Helps explain the project clearly to instructors and evaluators.
• Serves as a reference for future improvements.
• Makes it easier for new users to understand the system.
• Provides technical details of the implementation process.

Documentation ensures that the project is well organized and easy to understand.
